Insight, control and efficiency for Corneel Geerts Transportgroup

Corneel Geerts Transportgroup relies on Orditoool to read out its tachographs automatically and to digitise the stock management of its spare parts, so it can deploy its fleet to best effect.

Founded in 1962, Corneel Geerts Transportgroup grew into a household name as a groupage specialist for SMEs looking for one accessible carrier and forwarder for all their transport across Europe. Today the three grandsons form the third generation at the head of the company, watching over its further growth with an eye for the smooth service and the human touch that have driven its success for sixty years.

Fast, accurate and complete

The fleet today counts 150 vehicles and 200 trailers. Where the tachographs used to be read out by hand, this now happens entirely digitally and automatically, thanks to the software and the plug-and-play digiDL hardware from Orditoool. "Not only is the read-out much faster, the data is also more accurate and complete", says transport manager Sven Geerts. "It helps as a check on payroll processing and lets us tell drivers when they are not respecting driving and rest times. And we get through inspections more easily, because everything is perfectly documented."

The tachograph data also offers a solid digital basis for analysing driver performance and planning transport. "Originally the solution went no further than reading out the tachographs, but I was curious about the insights they could offer. Orditoool listened to my needs and developed the software further so that we

get the maximum out of the data. That speaks for the quality of the solution, but also for the flexibility of Orditoool and their appetite for tailor-made solutions."

Workshop management

Corneel Geerts Transportgroup also uses Orditoool to digitise its workshop management. The stock of spare parts is held in the software. On the job sheet the mechanic notes which parts he used for a service, after which they automatically disappear from the stock. When an item reaches its lower limit, the software orders new parts from the right supplier at the lowest price.

"The cooperation with Orditoool is still going fantastically after all these years and remains of enormous added value. Thanks to the combination of following up our mechanics, the automatic stock management and the read-out of the tachographs, we save the equivalent of a part-time job."
